

YOUR GITHUB. REIMAGINED.

One photo. Two character assets.

A profile that feels like your own corner of the internet.

01 CREATE

02 GENERATE

03 PUBLISH

FIRST, CREATE THE CHARACTER.

Upload a clear photo of yourself to an image-capable AI tool. Run these prompts separately; attach the first result when creating the second.

01 THE STYLIZED PORTRAIT

SAVE AS id.png

Transform my attached photo into a premium semi-realistic illustrated profile portrait. Preserve my recognizable face, skin tone, hairstyle and glasses. Give me a confident, approachable expression and stylish dark streetwear, with subtle electric-blue and crimson rim light. Frame me from the chest up with the full head visible. Use a genuinely transparent background with alpha, not a checkerboard drawn into the image. No text, badges, logos or extra objects. Export a sharp, high-resolution PNG.

02 THE RIGHT-POINTING CHARACTER

SAVE AS right_pointing.png

Use the attached stylized portrait as the identity and style reference. Create the same person in the same outfit, shown from the waist up, positioned to the left and pointing toward the viewer's RIGHT with a natural hand pose. Leave room around the head and pointing hand; do not crop either. Match the face, hair, glasses, colors and illustration style. Use a genuinely transparent alpha background. No text, handles, logos, arrows or badges. Export a high-resolution PNG.

TRANSPARENCY IS THE DIFFERENCE.

Check both PNGs on a dark and a light background. If gray checkerboard squares remain visible, they are baked in: use a background-removal tool and export PNG with alpha. Keep the face intact; save the clean files under the names above.

THE MASTER BUILD PROMPT.

Attach **id.png** + **right_pointing.png** to a coding agent that can create files.

Replace every [placeholder], then paste the complete prompt below.

YOUR DETAILS / FILL THESE FIRST

Name: [NAME] | GitHub: [USERNAME] | Role/company: [ROLE + COMPANY]
Location: [CITY] | Pitch: [ONE SENTENCE] | Roles: [UP TO 4]
Stack: [TECHNOLOGIES] | Hobbies: [3 INTERESTS]
Projects: [3 NAMES + ACCURATE DESCRIPTIONS + URLS]
Socials: [EXACT LINKEDIN, YOUTUBE, INSTAGRAM, TOPMATE URLS]
Verified stats: [METRIC + VALUE + DATE, OR OMIT]

COPY / PROMPT 03

TASK

Build my complete animated GitHub profile README. Use the attached id.png for every portrait and right_pointing.png for the connect section. Preserve those exact images and their alpha; do not redraw my face or invent silhouette masks. Ask for any missing personal facts or URLs instead of guessing.

ART DIRECTION

Create a bold, polished design with deep navy #070b16, electric blue #247bff, crimson #ff354f and off-white text. Use oversized display typography, spacious layouts, rounded cards, subtle dot texture and gradient hairline borders. Embed a licensed display font and mono font as base64 WOFF2; include licenses. Keep everything legible at GitHub README width.

BUILD THESE FILES

assets/hero.svg: typed greeting, large rising-mask name reveal, four cycling roles, one-line pitch, portrait and location/company row. assets/about-life.svg: capabilities beside a three-slide interests carousel, changing every 4 seconds with segment progress bars. assets/stack.svg: correctly labelled tech icons on three tilted elliptical orbits plus grouped stack chips.

MAKE THE DETAILS COUNT

assets/id-dashboard.svg: a hanging lanyard ID with metal clasp, portrait, barcode and subtle foil/light sweep. Drop it into place, settle with damped pendulum motion, then maintain a gentle +/-1.7-degree swing. Show only verified, dated metrics and repo data; omit unknown counts. assets/connect.svg: my pointing character on the left, generously spaced social cards on the right, platform icons and nudging arrows. Use the links I supplied.

GITHUB-SAFE IMPLEMENTATION

Each SVG must be self-contained: inline PNGs and fonts, namespace IDs, and make no network requests when rendered. Use CSS + SMIL only: no JavaScript, foreignObject or externally loaded assets. Give CSS entrances fill-mode both. Start SMIL at 0s; use keyTimes for delays and readable final base values if animation is unsupported. Respect reduced motion. Use Simple Icons where available; otherwise obtain the official brand mark and document its source.

PACKAGE AND VERIFY

Create README.md with all five relative image paths ending in ?v=1, a projects table and real clickable social links below the connect image; links inside an SVG image are not clickable on GitHub. Do not add a contribution-city section. Include preview.html and an upload-ready ZIP. Render every SVG at 0, 2, 5, 9 and 13 seconds, also with animation removed and as an img element. Check transparency, clipping, typography, spacing, mobile width, valid links and zero external asset requests. Fix problems before delivery and list exactly which files I must upload.

PUT IT ON YOUR PROFILE.

No website hosting. No deployment. Just a public profile repository.

01 CREATE THE RIGHT REPO

On GitHub: + > **New repository**. Name it exactly your username; choose **Public** and **Add README**. Example: **alexdev/alexdev**. If it already exists, open it.

02 UPLOAD THE ACTUAL FILES

Unzip the generated package. In the repo, choose **Add file** > **Upload files**. Drag in **README.md** and the **assets/** folder, preserving its structure. Do not upload only the ZIP.

03 COMMIT YOUR UPDATE

Replace the starter README with the generated one. Add a commit message and save to the default branch. If you use a new branch, open and merge its pull request.

04 CHECK THE LIVE PROFILE

Visit github.com/YOUR_USERNAME. Confirm all images load and each social link opens correctly. Review desktop and mobile. The README must be nonempty and at the repository root.

REPOSITORY ROOT

```
README.md
assets/
  hero.svg
  about-life.svg
  stack.svg
  id-dashboard.svg
  connect.svg
```

README IMAGE WIRING

```
! [Intro] (./assets/hero.svg?v=1)
! [About] (./assets/about-life.svg?v=1)
! [Stack] (./assets/stack.svg?v=1)
! [ID] (./assets/id-dashboard.svg?v=1)
! [Connect] (./assets/connect.svg?v=1)
```

Add real social links beneath these images.

MISSING IMAGE?

Check filename case and relative paths. Upload assets as well as README.md.

OLD VERSION?

Replace the SVG, then change its image link from ?v=1 to ?v=2.

STATIC RENDER?

Use the readable fallback. Check in a browser; not every viewer plays SVG motion.
